Section: 11

EXPERIMENT – 1

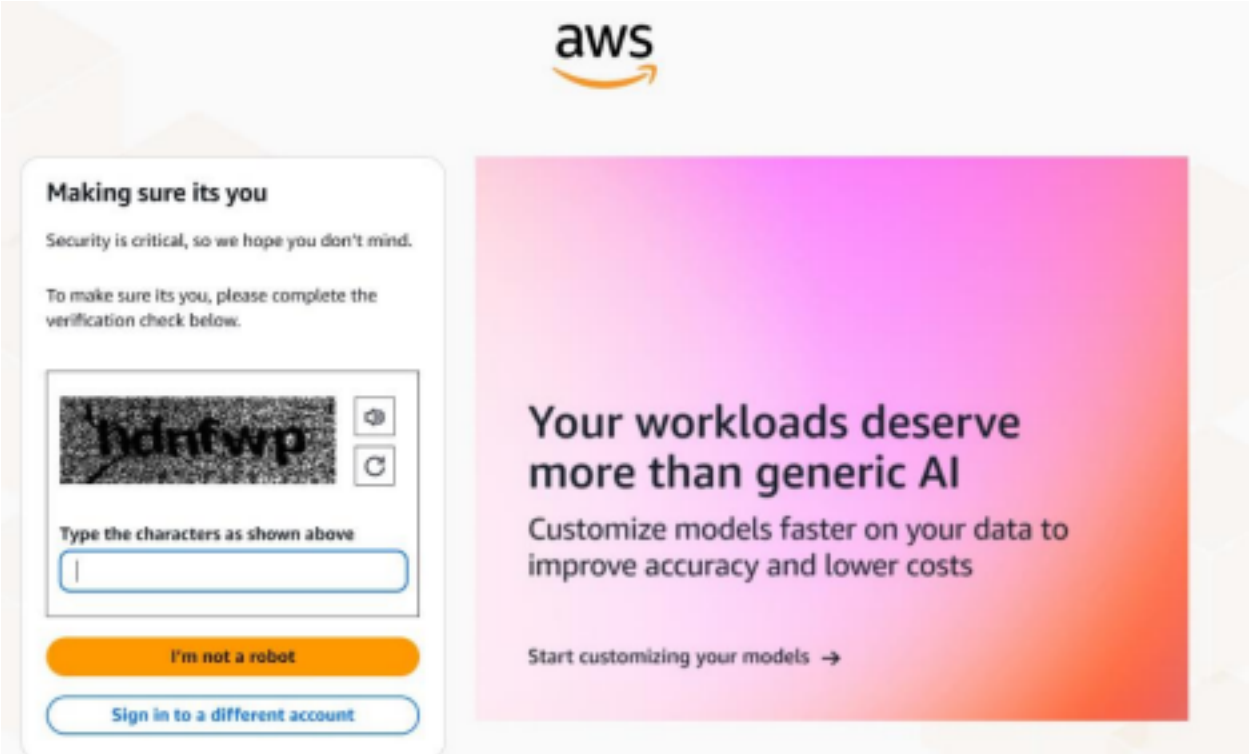

Creating AWS account

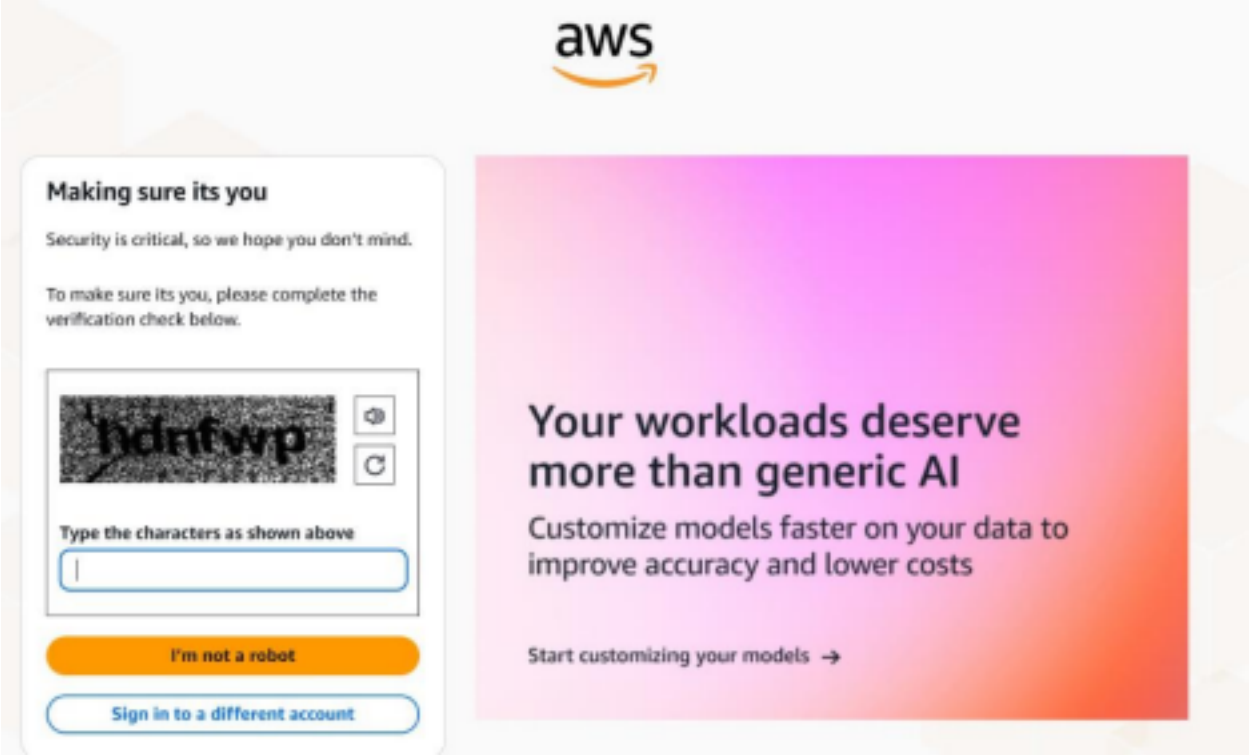

Starting point for creating an AWS account and accessing AWS services.

The AWS sign-in page is displayed, where the user enters an email address to begin the account registration process.

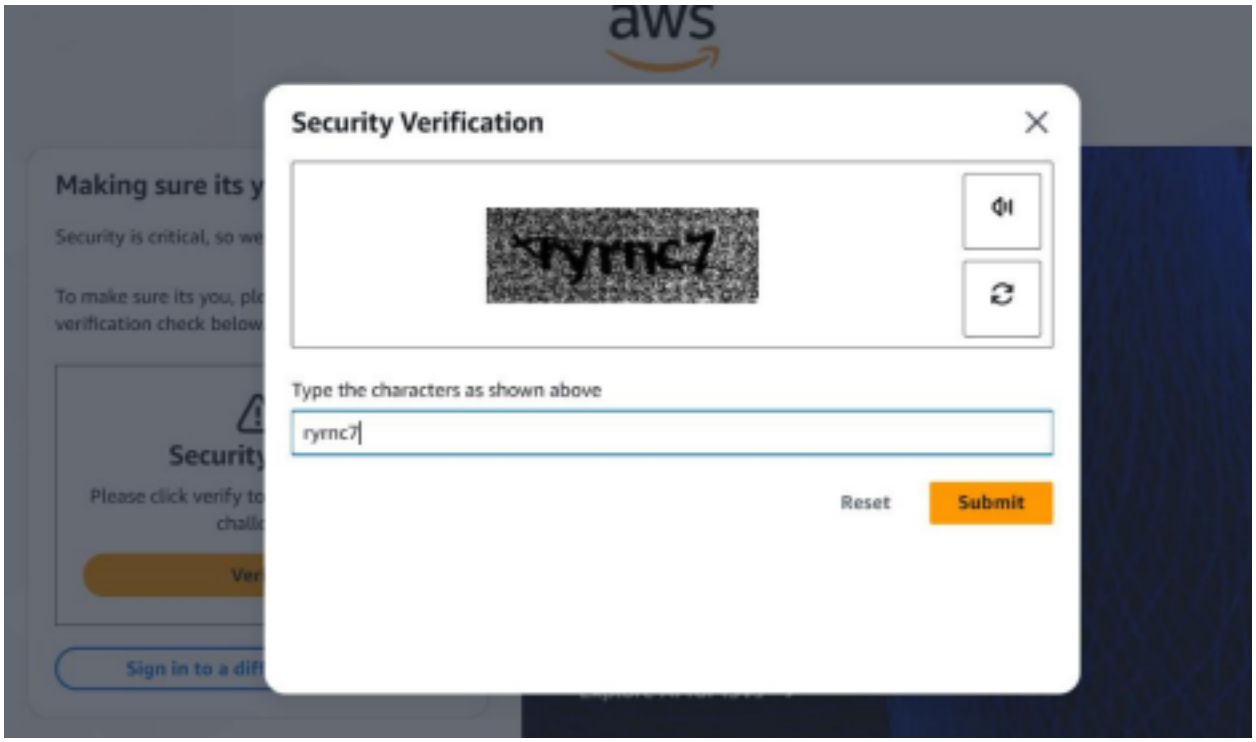

AWS asks the user to verify the email address. The verification screen displays a code-entry field to confirm ownership of the email account.

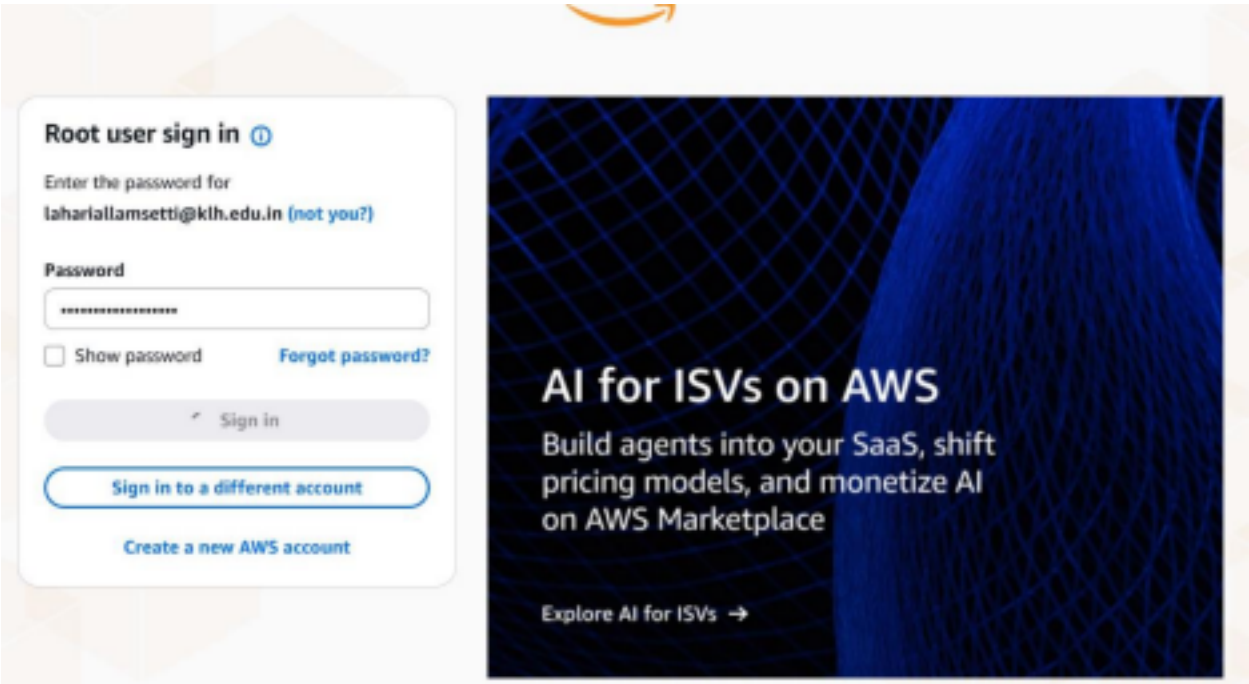

The AWS registration form, where the user provides the required account and the AWS registration form, where the user

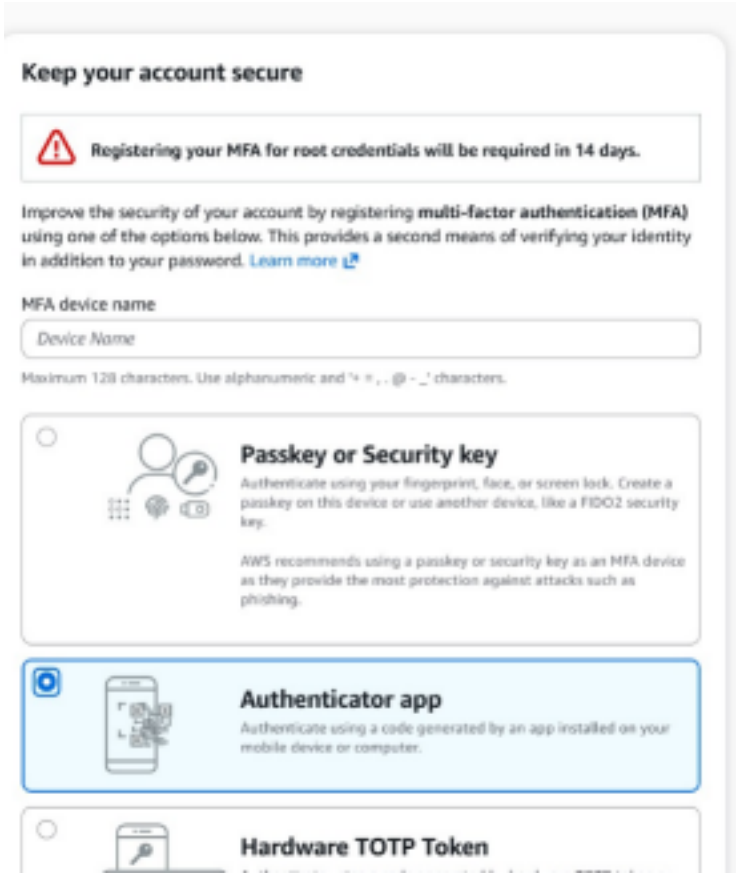

provides the required account and contact details.

A security verification challenge is displayed. The user must enter the characters shown to continue creating the AWS account.

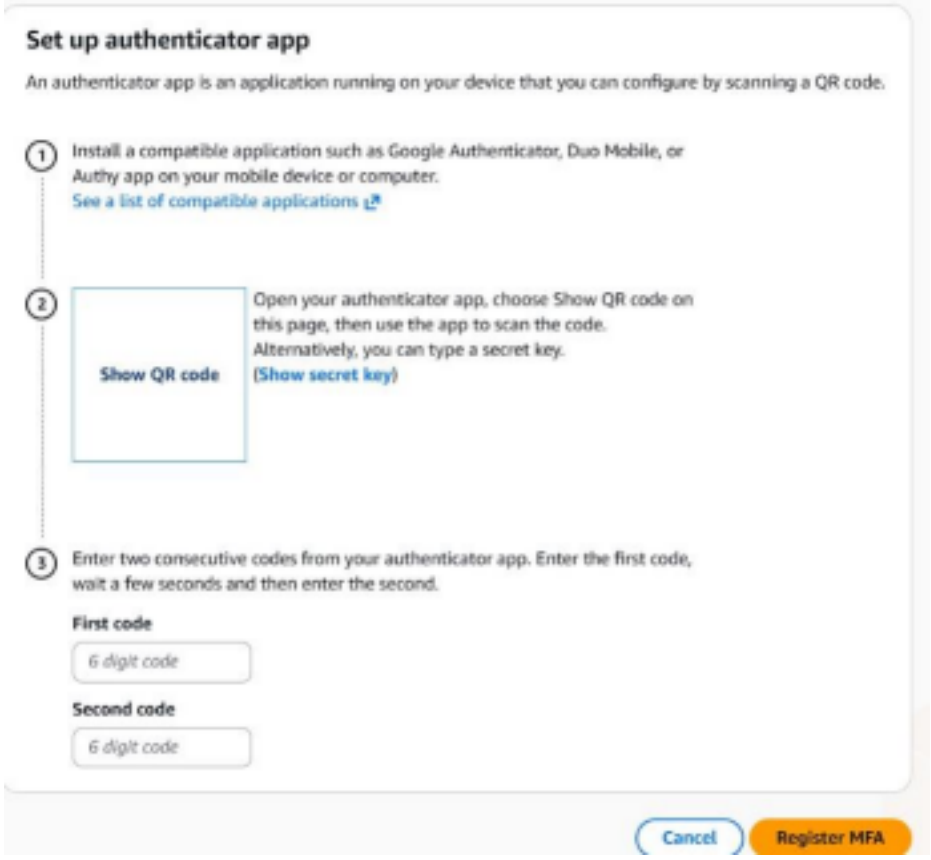

Applying multifactor authentication to AWS account

The AWS root user sign-in page is shown. It is used to access the account with the registered email address and password, before enabling multifactor authentication.

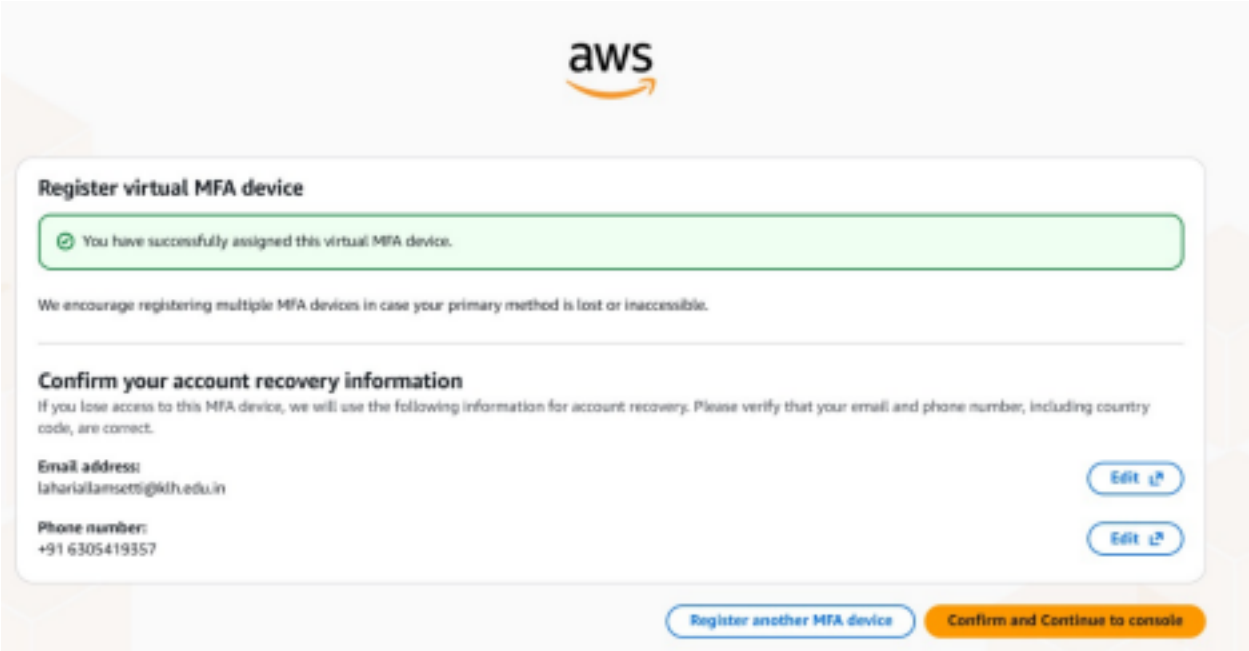

Description: This screen presents the available security options for the AWS account. The Authenticator app option is selected to add an extra layer of protection through multifactor authentication.

AWS displays instructions and a QR-code option for linking an authenticator app to the account.

Set up authentication app

The virtual MFA device has been registered successfully and that the account security setup is complete.
